

How my HTML and CSS work together to create my portfolio page?

How my HTML and CSS work together

My portfolio is built using HTML and CSS. I think of HTML as the structure of my website and CSS as the way that structure looks.

In my index.html, I created different sections such as Home, About, Projects, Future Work, and Contact. Each section has an id, such as id="projects" or id="contact". This is why the navigation links can take me directly to those sections. For example, the Projects navigation link uses href="#projects".

My project cards are also created in HTML. Each project has its own heading, description, technologies, and a link to its case study.

The **style.css** file controls how all of this looks. For example, .projects uses CSS Grid to arrange my project cards into two columns. The @media rule changes this to one column on smaller screens, which makes the website work better on mobile.

I also learned that the HTML and CSS are connected through the <link rel="stylesheet" href="style.css"> line in my HTML. Without this connection, the page would still have its content, but it would not have the styling I created.

So, in simple terms, **HTML tells the browser what is on my website, while CSS tells the browser how I want it to look and behave visually.**
