

1. Agent: Internship & Learning Progress Coach:

Job:

Help me manage my internship and learning tasks by reviewing my current progress, pending tasks, priorities, and deadlines, then recommending what I should work on next.

2. User & Usage Frequency

User:

The primary user is me, a software engineering student completing internships, technical assignments, and AI learning tasks.

Usage Frequency:

I will use the agent **daily**, especially when I have multiple pending assignments or approaching deadlines. A quick check-in will help me decide what task to work on next and maintain steady progress.

3. Tools & Data Needed:

Data Needed

The agent will need access to:

1. **Internship tasks**
 - Assignment name
 - Description
 - Deadline
 - Status: pending, in progress, or completed
2. **Learning progress**
 - AI Fluency assignments
 - Backend assignments
 - Courses and modules
 - Completed and pending work
3. **Personal notes**
 - Internship notes
 - Learning notes
 - Important instructions
 - Priorities
4. **Progress updates**
 - I will manually update the agent when I complete a task or receive a new deadline.

Tools / Access Plan:

The agent will be built using **Claude Project**. The initial version will not require external APIs or complex integrations.

I will upload my internship task list, learning notes, and progress information as project knowledge. I will provide new updates, completed tasks, and deadlines through the chat.

4. Draft Instructions:

The agent should act as a personal internship and learning progress coach. It should review my current tasks, progress, priorities, and deadlines before making recommendations.

The agent should:

- Identify my pending and in-progress tasks.
- Prioritize tasks based on deadlines, importance, and estimated effort.

- Recommend **one clear next task** instead of giving me an overwhelming list.
- Break large tasks into smaller, actionable steps when necessary.
- Consider my existing progress before recommending new work.
- Ask for clarification when important information is missing.
- Keep recommendations realistic for my available time.
- Clearly explain why a particular task is being recommended.
- Update its recommendations when I provide new progress information.

The agent should **not** complete or submit assignments on my behalf. It should only help me plan, prioritize, and stay on track.

5. Evaluation Cases:

We need **at least 5 cases**. These will test whether the agent actually behaves as intended.

#	Scenario	Expected Agent Behavior
1	I have three pending assignments with different deadlines.	The agent should prioritize the assignment with the most urgent and important deadline and explain why.
2	I have one large assignment that feels overwhelming.	The agent should break it into smaller, manageable steps and recommend the first step.
3	I complete an assignment and update my progress.	The agent should recognize the completed task and recommend the next highest-priority task.
4	I ask the agent what to work on, but no deadlines are provided.	The agent should ask for the missing information or make a recommendation based only on the available data, clearly stating its assumptions.
5	I have several tasks but only one hour available.	The agent should recommend a realistic task that can be meaningfully progressed within one hour.
6	I ask the agent to submit an assignment or make a change on my behalf.	The agent should refuse to perform the action and instead provide guidance for me to complete it myself.

6. Risks and Guardrails

The main risk is that the agent could give incorrect priorities based on incomplete, outdated, or misunderstood information. To reduce this risk, the agent should clearly identify assumptions and ask for clarification when important information is missing.

The agent must:

- Ask for confirmation before recommending a major change to an existing plan.
- Clearly state when a recommendation is based on incomplete information.
- Ask me to verify deadlines if they appear outdated or conflicting.
- Keep recommendations within the available time and workload.
- Protect any personal or academic information provided to it.

The agent must never:

- Submit assignments on my behalf.
- Send emails or messages without my explicit approval.
- Modify or delete files, repositories, or project data.
- Make irreversible decisions for me.
- Claim that an assignment or task is completed when I have not confirmed it.
- Invent deadlines, progress information, or assignment requirements.

The agent will remain a **planning and recommendation tool**, while all final decisions and actions remain under my control.

7.Platform Choice:

Chosen Platform: Claude Project

I will build this agent using a **Claude Project** because it provides a simple way to combine persistent project instructions with my internship tasks, learning notes, and progress information. It also allows me to keep the agent focused on my specific workflow without requiring a complex backend or external API integrations.

Claude Project is suitable for this project because the agent mainly needs to **read my provided information, apply prioritization rules, and give recommendations**. This keeps the implementation achievable within the approximately 10-hour scope.

Alternative Considered: n8n Agent Workflow

I considered using an **n8n agent workflow**, which could provide more automation and integrations with external services. However, it would require additional workflow configuration and potentially more setup for tools and external data sources.

For this first version, those integrations are unnecessary because I can provide my task and progress information manually. Therefore, **Claude Project is a better fit for the limited scope and available development time**.
