

1. Reviewer Feedback

What do I do?

The reviewer understood within 5–10 seconds that I am a **Software Engineering Student & UI/UX Designer** who combines software development with UI/UX design.

Would you believe I'm good at it?

The reviewer said yes because the portfolio contains structured project cards, real technical work, UX methodologies such as the Steady case study, backend technologies like Node.js, Express and SQLite, and a clean, distraction-free layout.

However they felt that the portfolio does not fully prove the quality of the work yet because some projects could benefit from more visual evidence, screenshots, mockups or interactive demos.

2. Must-fix

Remove the “Future Work / Coming Soon” section

The reviewer felt that this makes the portfolio look unfinished.

Improve project visual proof

Add thumbnails/mockups/screenshots to project cards where possible, especially for UI/UX work.

Make my main focus clearer

I should clarify whether my primary focus is Frontend/UX, Backend, or a combination, so recruiters can quickly understand what role I am targeting.

3. Nice-to-have

Add more visual previews/Figma screenshots.

Add live interactive demos where available.

Reduce the amount of text on project cards.

4. Feedback I will act on

I did not defend the original design. The feedback showed me that although the portfolio communicates what I do clearly **showing visual proof of my work is important** especially for UI/UX projects.

I will first address the must-fixes by removing the unfinished “Coming Soon” section and improving the project presentation/positioning.

What I changed

I acted on the must-fix feedback instead of defending the original design. I removed the unfinished placeholder section, improved the visual presentation of projects, and clarified my positioning.

Evidence: The updated changes are live on my portfolio:
