prompt

Output:

Home — doesn't prove anything, and that's a problem

Home's only job is to filter fast: state your specific claim in one sentence and route people to evidence within 3 seconds. The risk with a two-part claim (design skill + AI/full-stack skill) is that most portfolios trying to prove both end up sounding like two different people — a generic "aspiring designer/developer" line that proves neither. Your Home copy needs to make the *combination* the point (e.g., "I design interfaces people actually use, then build the AI-powered systems behind them" — not two hobbies, one skill set). If Home is just a hero image and a nav bar, it's dead weight. It should also tease 2-3 projects and carry a persistent CTA — don't make Contact the only exit ramp.

Work / Case Studies — this is doing 90% of your persuasion, and the name is hiding a structural gap

"Work / Case Studies" reads like one page, but it can't be — you need an index (grid of projects) plus a detail page per project, or the "proof" is a paragraph, not a case study. Be explicit about that in your build even if it's not a separate sitemap line.

Bigger risk: not every project needs to prove both claims, but if *no* project proves both, you haven't actually demonstrated the combination you're selling. A recruiter skimming for UI/UX work and one skimming for AI/backend work should each find at least one project that satisfies them fully — ideally 1-2 projects that hit both (user research/wireframes → architecture/AI integration → outcome). If your case studies are just screenshots and a GitHub link, that proves neither design thinking nor engineering depth — it proves you can deploy something. Structure matters more than page count here.

About — likely your weakest link, not because it's unnecessary but because it's usually wasted

About is often the page where portfolios quietly stop supporting the proof statement and turn into a bio ("I love coffee and hiking"). That's fine for personality but does nothing for your goal. It should instead answer: why does one person do both design and AI engineering, and why does that make you *better* at each (e.g., you design with technical constraints in mind, or you build AI features with usability in mind). If it doesn't reinforce the thesis, cut the fluff and keep it short. This is also where your resume should live as a download — not as its own sitemap page (adding a "Resume" page would violate your simplicity goal; a download button doesn't).

Contact — fine as an endpoint, but check it's not the only conversion point

If Contact is a form buried at the end of a linear path, you're relying on people reading everything before converting. Most recruiters won't. Put a resume-download + email/LinkedIn combo directly in the nav or as a sticky element, so Contact is reachable from every page, not just the last one in the sitemap order.

What's missing

- A visible skills/stack signal — but don't add a page for it. A dedicated "Skills" page is usually filler; embed a tech-stack strip on Home and repeat relevant tools inside each case study instead. Keeps the site lean and ties skills to evidence rather than listing them abstractly.
- Resume access — critical, and missing entirely from your sitemap. Solve with a download link, not a page.
- Explicit split within Work between design-led and engineering-led projects, if your project mix is uneven — a filter or tag system (not more pages) once you have 4+ projects.

What's unnecessary

Nothing on the list should be cut — four pages is already minimal. The failure mode here isn't bloat, it's that "Work / Case Studies" is under-specified (needs detail pages) and "About" risks becoming proof-free filler. Don't add a blog or testimonials page unless you have strong, specific content for them — for an internship-stage portfolio they usually dilute rather than help.

Net verdict

The sitemap skeleton is right-sized. The actual risk is content, not structure: Home has to state a merged claim instead of two separate ones, Work needs a real index+detail structure with at least one project proving both skills, About needs to be argument-driven rather than biographical, and Contact/resume access needs to be persistent rather than end-of-funnel. Fix those four things and the four-page structure will do its job.

Change I will make: I will update my Home page so that it clearly communicates my unique value as a Software Engineering student with UI/UX and AI Engineering experience. I will also expand the Work section into a project index with detailed case studies, ensuring at least one project demonstrates both strong UI/UX design and AI-powered full-stack development. Finally, I will rewrite the About page to explain how combining design and engineering helps me create better user experiences.
